QAZSPLIT / DEMO DAY

One client. Everyone paid.

Direct token payments for small teams.

Solana devnet

Mock tokens only

Working prototype. No mainnet. No real money.

PROBLEM HYPOTHESIS

Who forwards the team's payment?

50%
Developer

30%
Designer

20%
Manager

One project. A shared allocation.
Manual forwarding puts coordination on someone.

Illustrative scenario; customer pain and savings have not been measured.

THE PRODUCT

Set once. Pay directly.

01 / Create Split

Two to five unique recipients

Exactly 10,000 basis points

Fixed onchain configuration

02 / Pay Split

Review and simulate

One payer-signed payment

Direct recipient transfers

Setup has its own creator transaction. No escrow, custody, backend, login or indexer.

LIVE DEMO / TEST TOKENS ONLY

10 in. 5 / 3 / 2 out.

+5

Developer · 50%

Previously verified devnet receipt ↗

`Slot 507827153 · 1 signature · transaction error: null`

Mock USDC, six decimals. Figures are token balance increases, not dollar value or current balances.

WHY SOLANA

Settlement, not a spreadsheet.

SplitConfig PDA

Recipients · mint · shares

→

QazSplit program

Check recorded rules

→

Token Program

Payer → recipients

Every transfer commits together, or token changes revert.
Wallet authorization and a public transaction receipt.

Other smart-contract chains can also do this. Solana atomicity · PDAs · CPIs. Failed transactions can still incur fees.

COMPETITIVE CONTEXT

Narrower by design.

Project	Evidence-backed emphasis
Fideox ↗	Project treasury · deposit / distribute[1]
Splitter ↗	Vault deposits · percentage claims[2]
SplitPact ↗	Business graphs · conditional routing[3]
QazSplit	**Fixed split · direct payer-to-team payment**

A workflow wedge, not a proven moat.

[1] Colosseum archive; current Fideox status unverified. [2] Public repository/archived source. [3] Current publisher claims. Checked 2026-10-05 UTC; fuller sources/limits in demo-day/evidence.md.

EVIDENCE / SCOPE

Working proof. Honest limits.

Technical evidence

- Verified devnet 50/30/20 receipt
- Local atomic rollback test
- Mint, balance and mutation checks

Not established

- Customer demand or revenue
- Audit or production readiness
- Mainnet or real-USDC support

Failure-path tests are prior local program results. Demo Day frontend validation is recorded separately. Technical proof ≠ traction.

THE NEXT QUESTION

Help us test the workflow.

Feedback from small teams already paid on Solana.

Would you use a fixed split instead of forwarding payments?

Proposed feedback ask, not existing traction or a committed product roadmap. Devnet prototype only.
