QAZSPLIT / DEMO DAY

One client.
Everyone paid.

Agree on shares. Pay by milestone. Verify every payout.

Solana devnet

Mock tokens only

Working prototype. No mainnet. No real money.

PROBLEM HYPOTHESIS

Who forwards the team's payment?

50.00%	30.00%	20.00%
Developer	Designer	Manager

One project. A shared allocation.
Manual forwarding puts coordination on someone.

Illustrative scenario; customer pain and savings have not been measured.

OUR FIRST USERS / HYPOTHESIS

Small teams. Shared project income.

A narrow starting point

- Two to five teammates
- Client-funded project work
- Already comfortable with Solana wallets

Not trying to be

- A bank or fiat on-ramp
- An escrow or dispute service
- A full payroll platform

Intended segment, not an existing customer base. Every participant needs a wallet; signers need devnet SOL.

THE PRODUCT

Agree first. Pay directly.

01

Propose

Recipients, shares and milestones

→

02

Approve

Every recipient signs their own share

→

03

Pay

Client signs one atomic payment

→

04

Verify

Receipt, balances and wallet history

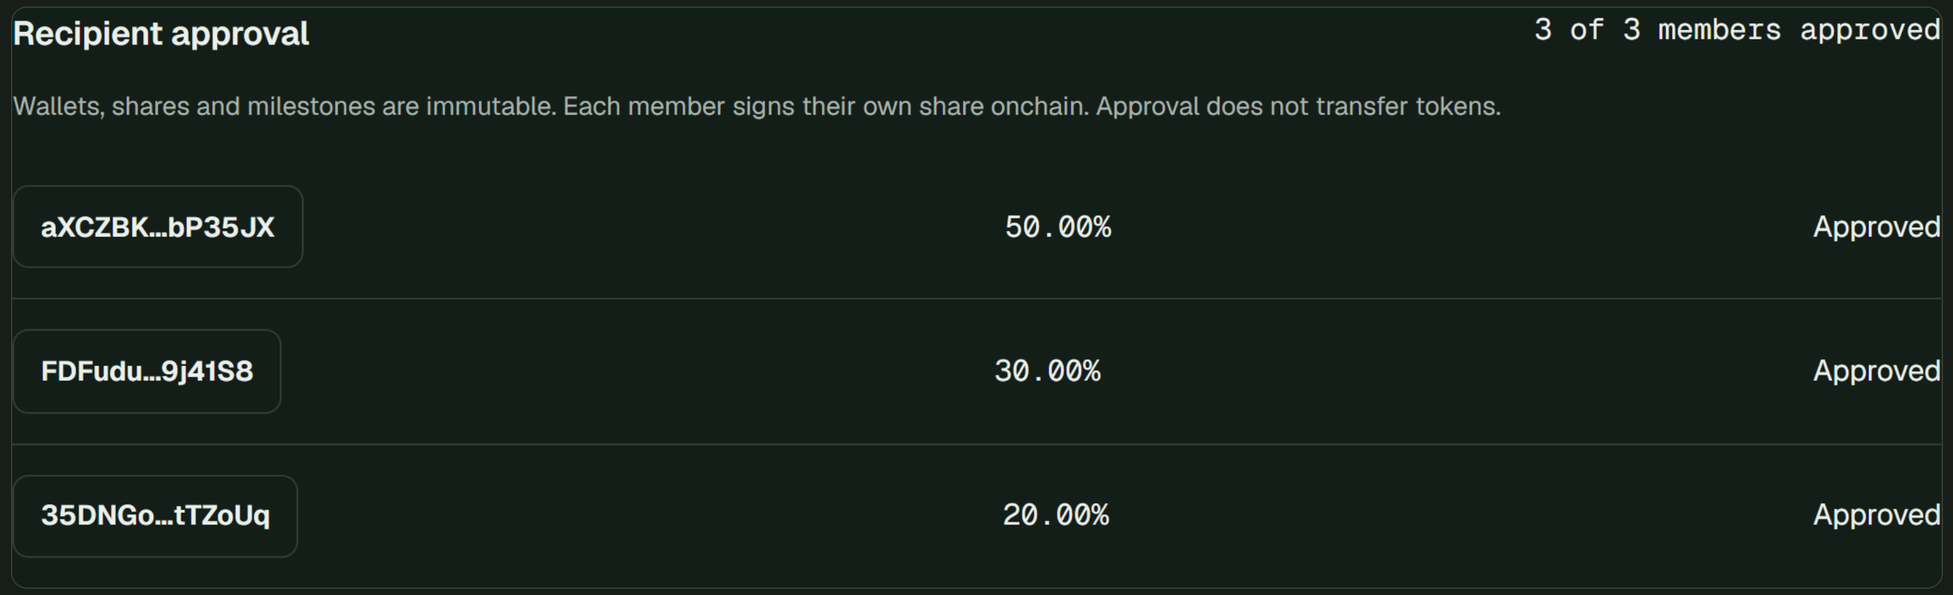

Money moves from client to recipients. Never through a QazSplit vault.

Proposal and recipient approvals are separate transactions. One payer signature per milestone payment, not per entire agreement.

RECIPIENT APPROVAL / ONCHAIN

Nobody's share is assumed.

2 / 3 · Pending ⟶ 3 / 3 · Active / Locked State transition / illustration

Real devnet UI · all three approvals recorded onchain

Each recipient signs their own share. Payment waits for everyone.

Screenshot captured 2026-10-10. The 2/3 → 3/3 diagram is illustrative, not a recording of new signatures. Terms are fixed from proposal.

MILESTONE PAYMENTS

One agreement. Separate project stages.

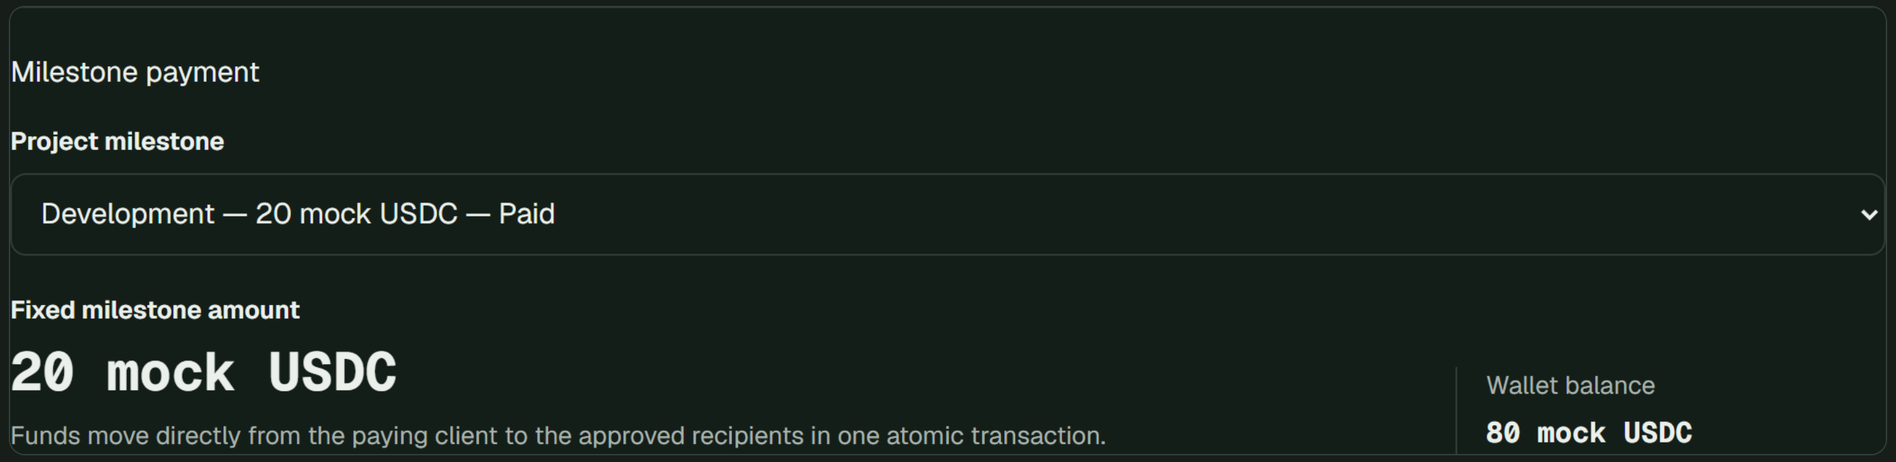

Demo milestone	Fixed amount	Verified example status
Design	`10 mock USDC`	Paid
Development	**`20 mock USDC`**	**Paid · receipt available**
Launch	`10 mock USDC`	Unpaid at verification

The same approved shares apply to every stage.
Each milestone can be paid once.

Devnet example checked 2026-10-10. No escrow, automatic release, delivery verification or dispute resolution.

VERIFIED PAYMENT / TEST TOKENS ONLY

20 in. 10 / 6 / 4 out.

Real devnet UI · Development already paid · not a new transaction

+10 mock USDC

Recipient 1 · 50.00%

+6 mock USDC

Recipient 2 · 30.00%

+4 mock USDC

Recipient 3 · 20.00%

Verified Development payment ↗

Slot 509571296 · 1 signature · finalized · error: null

Mock USDC, six decimals. Figures are token balance increases, not dollar value or current balances.

PAYMENT PROOF / HISTORY

A receipt the team can verify.

Development · 20 → 10 / 6 / 4

Payment receipt Paid

Development · **20 mock USDC**

Recipient 1 · **10 mock USDC**
aXCZBKwKMSiDkftZd3m6Gky7FAsNpTnXA2yN9bP35JX

Recipient 2 · **6 mock USDC**
FDFuduBsUvAqHEEiCAPxi3xWgb93cBPYu2SiMd9j41S8

Recipient 3 · **4 mock USDC**

QazSplit never held the funds

Reopen from History

Exact amounts. Recipient addresses. Signature. Onchain timestamp.

Open wallet history ↗

Actual UI captures, 2026-10-10; existing confirmed payment. QazSplit never held the funds. Public RPC retention/rate limits apply.

WHY SOLANA

Settlement, not a spreadsheet.

Agreement PDA

Shares · approvals · milestones

→

QazSplit program

Check approval and unpaid stage

→

Token Program

Payer → recipients

Every transfer commits together, or token changes revert.
Solana-native wallets, SPL tokens and verifiable agreement state.

Other smart-contract chains can also do this. Solana atomicity · PDAs · CPIs. Failed transactions can still incur fees.

COMPETITIVE CONTEXT

An agreed project payment, not a treasury.

Project	Evidence-backed emphasis
Fideox ↗	Project treasury · deposit / distribute[1]
Splitter ↗	Vault deposits · percentage claims[2]
SplitPact ↗	Business graphs · conditional routing[3]
QazSplit	**Recipient approvals · milestones · direct payouts**

Our focus: consent → project stage → direct payment → proof.

[1] Archive checked 2026-10-05; current status unverified. [2] Repository README. [3] Publisher claims. Sources [2]/[3] rechecked 2026-10-10; no competitor audit or feature-exclusivity claim.

EVIDENCE / SCOPE

Working proof. Honest limits.

What was checked	Evidence / result
Recipient approvals · unauthorized / duplicate	Recorded local tests · passed
Wrong mint · insufficient balance · rounding	Recorded local tests · passed
Atomic rollback · repeated milestone payment	Recorded local tests · passed
Development payment · `20 → 10 / 6 / 4`	**Devnet transaction · finalized**
Local test suites	`26` Anchor + `109` frontend · passed

Not established: customer demand, revenue, audit or production readiness.
Devnet + mock USDC only. No mainnet or real funds.

Test results recorded 2026-10-10 in reports/history-devnet-verification.md; not rerun for this presentation. Technical proof ≠ customer traction.

THE NEXT QUESTION

Help us test the workflow.

Feedback from small teams already paid on Solana.

Try one devnet project payment.
Tell us where approval or payment gets confusing.

qazsplit.vercel.app ↗

Proposed feedback ask, not existing traction, fundraising or a committed roadmap. Devnet prototype only.
